

# AssetAsyst®

## Mobile Computing

### Mobile Mode

The 'Mobile Mode' in AssetAsyst® allows users to take AssetAsyst® out in the field to complete their works.

A version of the data can be downloaded onto a laptop computer device, which can be used to carry out inspections and complete work orders. The laptop can then be connected back to the network and the changes, such as defects,

condition, new assets and photos, can be uploaded onto the network system.

This removes the double handling associated with paper based inspections and work orders, improving the operational work flow, and minimising the administration work back in the office.

### Inspection App

AssetAsyst® can also link into our 'Inspection App' that we have developed for android devices. This app simplifies inspections such as the Level 2 bridge inspection process, allowing generic details, component ratings, defects and photo attachments to all be created from within the app.
